

Repository Software as a Platform for the Registry of Open Access Repositories

Brody, T, Carr, L and Harnad, S

Abstract: We have migrated the ROAR service to a repository software-based platform. The goal of this project was to reduce the administrative overhead for us and improve the experience for users by enabling them to control and update their own records. We now have a flexible platform that makes it easy to add new ways of ingesting and exposing our data, as well as improving the presentation of the content within the ROAR web site
