**Open Access Statistics:  
An Examination how to Generate Interoperable Usage Information  
from Distributed Open Access Services**

# Overview

---

- Impact measures:
  - relevance
  - a categorisation
  
- Usage-based impact measures: standardisation?
  
- Project: Open Access Statistics
  - Aims
  - Technical infrastructure
  - Results
  - Outlook

---

# Impact Measures

„The ‚impact factor‘ is the most commonly used assessment aid for deciding which journals should receive a scholarly submission or attention from research readership. It is also an often misunderstood tool.“  
Dong et al. 2005

# Impact measures: relevance

---

## □ Individual level: *publish or perish*

- If you do not publish you do not have any scientific capital, reputation or impact
- Without any impact, you won't make your career

## □ Organisational level: evaluation

- Evaluation results determine prospective resources of institutes *and* the future main research
- Criteria: number of doctoral candidates, amount of third party funds, publications

# From publications to impact

---

- Scientific reputation (or scientific capital) is derived from publication impact
  
- Impact is calculated mostly by citation measures
  - Journal impact factor (JIF)
  - Hirsch-index (h-index)

*Especially within the STM domain*

# Citation impact: calculation

## JIF

In year  $X$ , the impact factor of a journal  $Y$  is the average number of citations to articles that were published in  $Y$  during the two years preceding  $X$

Garfield: „*We never predicted that people would turn this into an evaluation tool for giving out grants and funding.*“ From: Richard Monastersky (2005), *The Number That's Devouring Science* *The Chronicle of Higher Education*

## H-index

A scientist has index  $h$  if  $h$  of  $N$  papers have at least  $h$  citations each, and the other  $(N - h)$  papers have less than  $h$  citations each

# Citation impact: critical points

---

- ❑ Restricted scope, exclusion of many publication types
- ❑ Based exclusively on journal citation report / web of science
- ❑ Language bias: items in English language are overrepresented within the database, so they reach higher citation scores
- ❑ JIF focuses on journals: few articles evoke most citations
- ❑ JIF discriminates disciplines with lifecycles of scientific information > 2 years

→ Mixture of quality and popularity

# Impact measures: a categorisation

---

## □ Citation based measures

- Author-centred
- Delayed measurement: at first in the following generation of publications
- Impact of a separate object is mostly not described

## □ Usage based measures

- Reader-centred
- Measuring: on-the-fly and consecutive
- Impact of a separate object can be described
- Automated measurement is possible

# Impact measures: a categorisation, pt. II

---

**JIF = Journal Impact Factor**

**RF = Reading Factor**

**SA = Structure Author**

- based on networks built by authors and their activities, e.g. Google PageRank, citation graphs, webometrics

**SR = Structure Reader**

- based on document usage and its contextual information, e.g. recommenders, download graphs

Bollen, J. et al. (2005): *Toward alternative metrics of journal impact: A comparison of download and citation data*. In: Information Processing and Management 41(6): S. 1419-1440.

Preprint Online: <http://arxiv.org/abs/cs.DL/0503007>

---

# Standards

*„An important issue, however, was the lack of standards on how to produce and report the usage data in a way that could be compared“*

Baker et al. 2008

# Usage based impact: standardisation?

---

-  **COUNTER** Counting Online Usage of Networked Electronic Resources

<http://www.projectcounter.org>

- *LogEc*

<http://logec.repec.org/>

- 

<http://www.ifabc.org/>

# Usage based impact: standardisation?

---

- The models mentioned differ in many aspects
  - Detection and elimination of non-human access (robots, automatic harvesting)
  - Definition of double click intervals
  - ...
  
- General problems
  - Ignorance of context information
  - Detection of duplicate users
  - Detection of duplicate information items
  - Ignorance of philosophical questions like: “What degree of similarity makes two files the same document?”

# Alternative impact measures: conclusion

---

- ❑ Alternative impact measures are possible
- ❑ But: very little standardisation
- ❑ Promising, but complex examples/models like MESUR  
<http://www.mesur.org>
- ❑ Requirement: sophisticated infrastructure to generate and exchange interoperable usage information within a network of several different servers

---

# **Project: Open Access Statistics**

# Open Access Statistics (OAS)

---

- 07/2008 – 02/2010
- Project partners:

Universität Stuttgart

HUMBOLDT-UNIVERSITÄT ZU BERLIN

NIEDERSÄCHSISCHE STAATS- UND  
UNIVERSITÄTSBIBLIOTHEK GÖTTINGEN

SAARLÄNDISCHE  
UNIVERSITÄTS-UND  
LANDESBIBLIOTHEK

Initiated by:

DEUTSCHE INITIATIVE  
FÜR NETZWERKINFORMATION E.V.

Funded by:

**DFG**

<http://www.dini.de/projekte/oa-statistik/english/>

# OAS: Aims

---

- ❑ A common standard to exchange usage data between different services
- ❑ An infrastructure to collect, process and exchange usage information between different services
- ❑ Usage information should be processed according to the standards of COUNTER, LogEc and IFABC
- ❑ Additional service for repositories
- ❑ Implementation guidelines

# OAS: Associated projects

---

- Open Access Statistics

- DOARC  
(Distributed Open Access Reference and Citation Services)

- Open Access Network

---

# Technical Infrastructure

*„Collecting, processing, and interpreting usage data is a challenge for libraries, big and small“*

Manoff et al. 2006

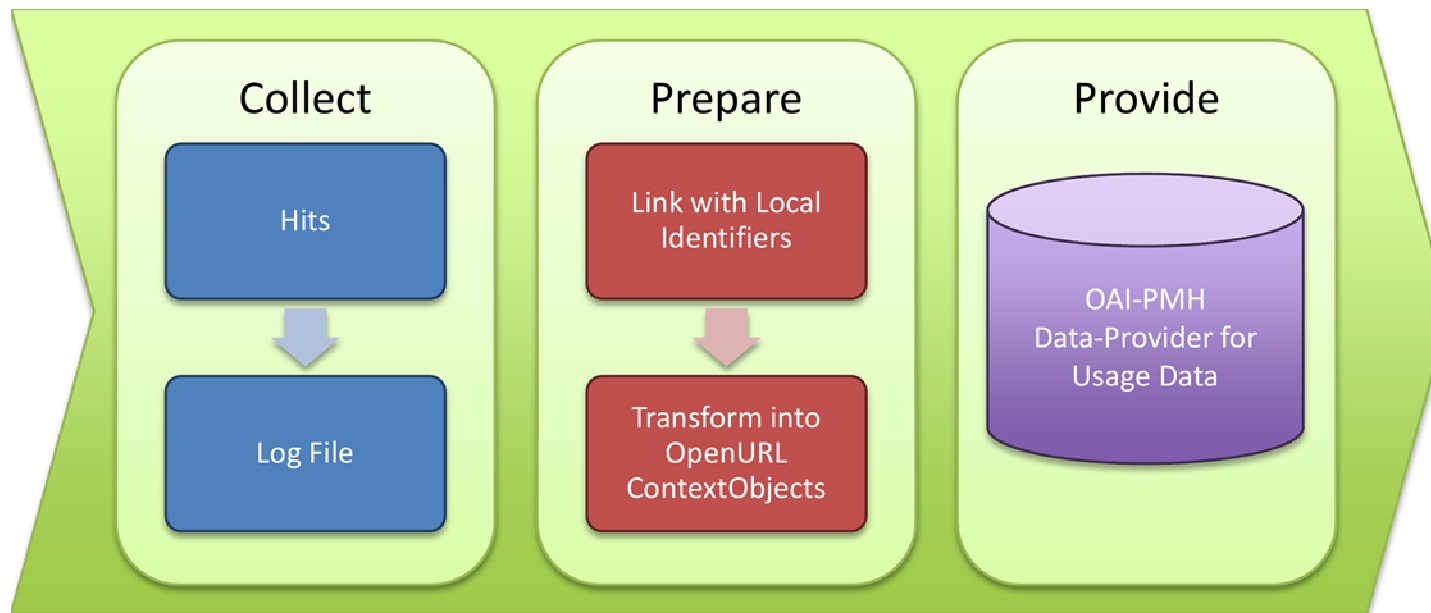

# OAS: Background

---

- ❑ Data pools at partner institutions
- ❑ Aggregation of usage events in a central service provider
- ❑ Services provided by the central service provider
- ❑ Usage data will be retransferred

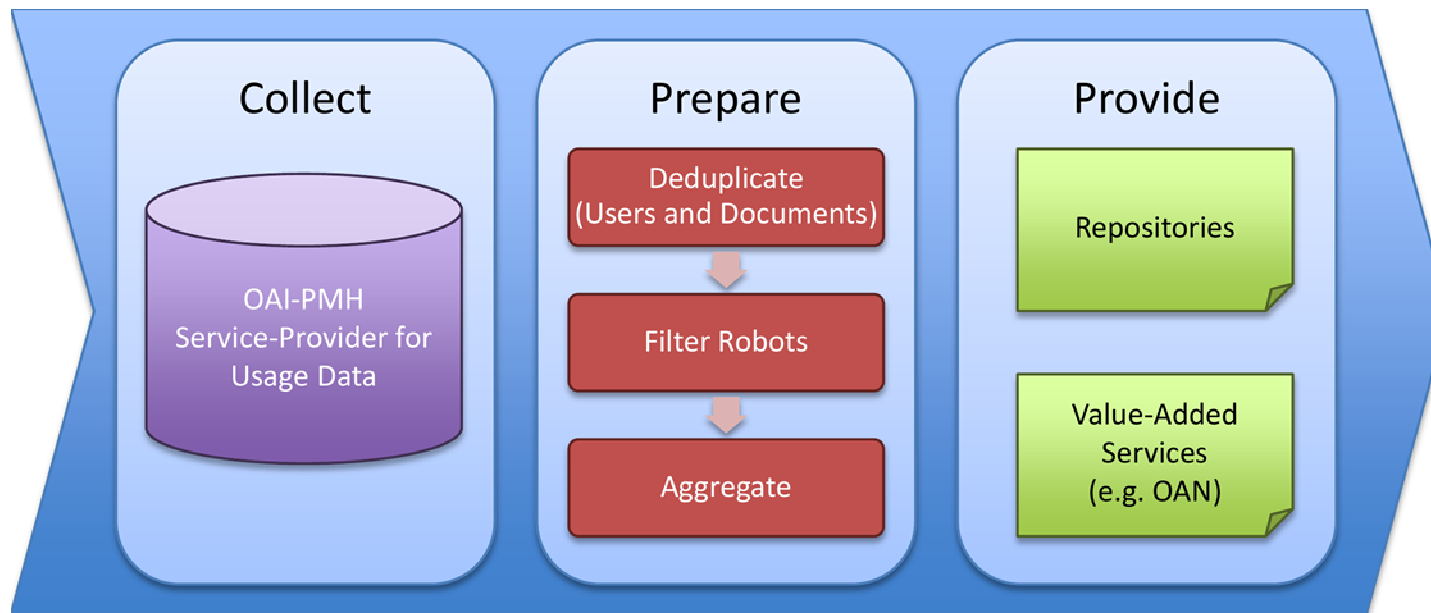

# OAS: Data provider

---

# OAS: Service provider

---

# OAS: Repository integration

Serie/Report Nr.: Organometallics, Vol. 12, 4, 1193-1200

**Zusammenfassung:** The set of alkali metal solid-state structures of  $\text{Ph}_3\text{CM-nL}$  ( $\text{M} = \text{K}, \text{Rb}, \text{Cs}; \text{L} = (\text{ligands}) \text{PMDTA}$  ( $\text{N}, \text{ZV}, \text{JV}^{\text{JV}}$ -pentamethyldiethylenetriamine), THF (tetrahydrofuran)) provides instructive comparisons.  $\text{Ph}_3\text{CK-THF-PMDTA}$  (1) crystallizes as a monomeric contact ion pair: the  $\text{K}^+$  cation is symmetrically  $\sigma$ -coordinated to one of the phenyl rings, but not to the deprotonated central carbon. Both  $[\text{Ph}\&\text{Rb-PMDTA}]$ . (2) and  $\text{P}^{\sim\sim}\text{CCWPMDTA}$  (3) form one-dimensional polymers and eschew THF. The Rb cations in 2 bridge the triphenylmethyl moieties by  $+x^{\text{m}}\%x\text{m}$ tion to separate phenyl rings. This gives rise to a zigzag chain. In 3, each Cs cation also bridges two carbanions, but in a somewhat different fashion. While  $\text{Cs}^+$  is located rather symmetrically (119 above the phenyl ring of one trit) moiety, a "smaller"-like coordination to a second trit anion

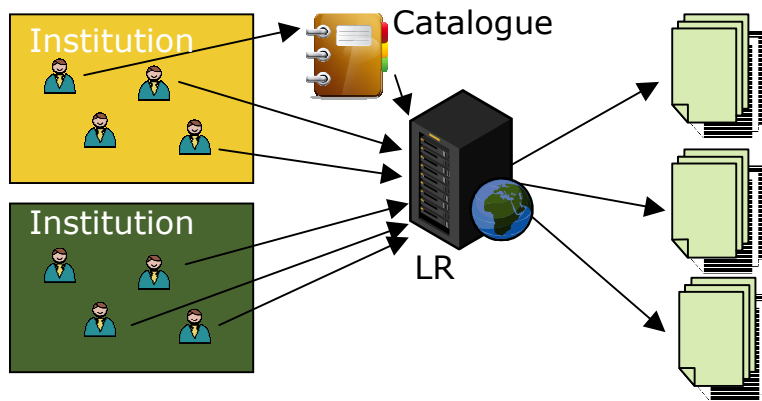

---

# Results and Outlook

# OAS: Lessons Learned

- ❑ The requirement for a central clearing house
- ❑ A lot of unnecessary data (OpenURL CO)  
→ increase of the data size by factor  $\sim 10$
- ❑ Different situation with Linkresolver

## USA

## Germany

# OAS: Results

---

- ❑ Infrastructure for exchange usage statistics
- ❑ Modules for OPUS- and DSpace-based repositories, other products can be configured easily (<http://www.dini.de/projekte/oa-statistik/english/software/>)
- ❑ Specification of the data format and exchange
- ❑ Online demo (<http://oa-statistik.sub.uni-goettingen.de/statsdemo>)
- ❑ Website with further information (<http://www.dini.de/projekte/oa-statistik/english/>)

# OAS: Further plans → OAS 2

---

Aims for a possible second funding:

- ❑ Opening the OAS infrastructure to offer standardised usage statistics
- ❑ Evaluation of metrics more sophisticated than the calculation of pure usage frequencies
- ❑ Cooperation for international comparable usage statistics
- ❑ Offer a suitable service infrastructure

# OAS: International cooperation
